

Hydreon

FIRE SERVICE + WATER PARTNERS

Close the defect loop — without the spreadsheet.

Give water companies a secure portal into defects and assets, with exports and API keys that fit undertaker processes — while the fire service keeps ownership of the operational picture.

Why the handoff breaks today

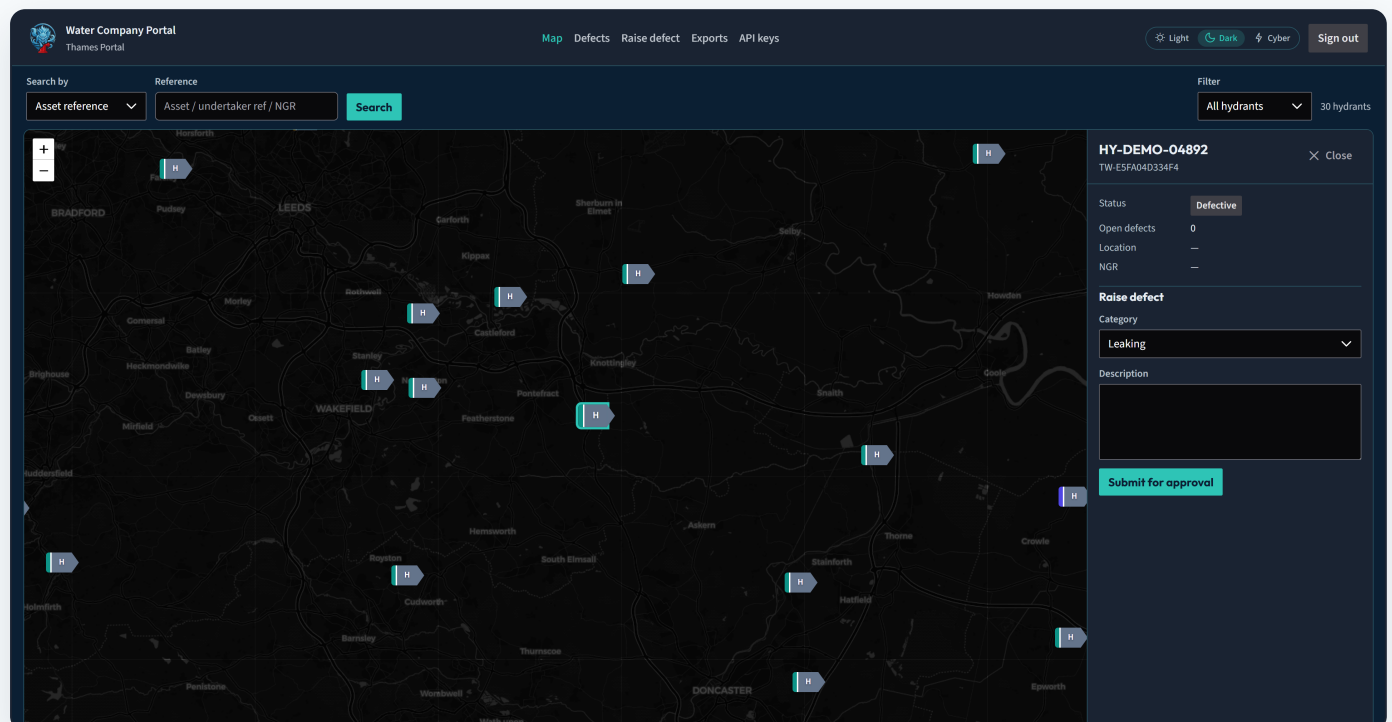

Defects stall in email threads and conflicting versions. Hydreon opens a controlled window for undertakers and keeps remediations tied to the same hydrant register your crews use in the field.

For fire & rescue

Raise and track defects from inspections or assets. Include remediations on routes. Export or share via portal without rebuilding the pack each time.

For water companies

Map, defects, raise/submit, and exports in one portal — plus API keys for partner systems. See what you need to remediate, not the whole fire-service estate.

Partner access, on your terms

Demo the portal alongside fire-service ops.

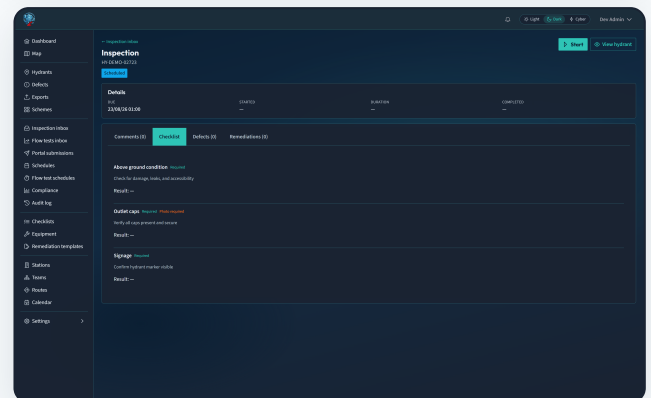

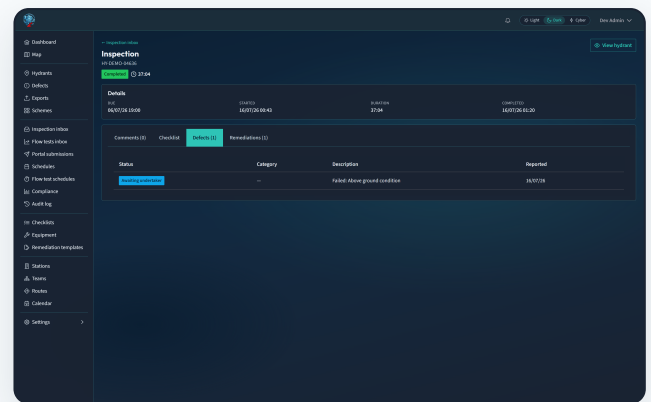

hydreon.co.uk/product/portal

hello@hydreon.co.uk

What partners get — and what stays with you

- **Portal map** — Spatial view of relevant assets and defects
- **Defects & raise** — Work the remediation loop in a purpose-built surface
- **Exports** — CSV / templates aligned to undertaker processes
- **Portal API keys** — For partner systems that need programmatic access
- **Integration API** — Hydrants, bbox, CSV export templates via X-API-Key

Fire services keep control of configuration, field capture, and what is shared. Partners get a secure window — not a second copy of your whole estate.

Bring your undertaker to the demo

We'll show portal, exports, and how defects land from the field.
